Ig heavy chain V region (N54P3-D-JH6) - human
C;Species: Homo sapiens (man)
C;Date: 19-Feb-1994 #sequence_revision 10-Nov-1995 #text_change 23-Jul-1999
C;Accession: S24252
R;Stewart, A.K.; Hunang, C.; Stollar, B.D.; Schwartz, R.S.
Rsbtewart, A.K.; Hunang, C.; Stollar, B.D.; Schwartz, R.S.
A;Describtion: A single VH gene predominates in the rearranged and expressed human B cell
A;Reference number: S24247
A;Accession: S24252
A;Status: preliminary
A;Nolecule type: DNA
A;Residues: 1-97 <STE>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Greates: Homo sapiens (man)

The consensus variable domain sequences are derived from the most abundant sublasses in the sequence compilation of Kabat et al., Sequences of Proteins of Immunological Interest, National Institutes of Health, Bethesda MD (1987), namely, VL-Kappa subgroup I and VH group III. In such igG-gamma-1 human consensus sequences, the VI consensus domain has the AA sequence in AAR47041, and the VH consensus domain has the AA sequence in AAR47042. (Updared on 25-WAR-2003 to correct PN field.)

The present sequence represents a Monkey antibody light chain linked to a theavy chain. The antibody binds to a target structure displayed in and on the cell surface of human gastrointestinal epithelial tumnur cells and in a subpopulation of normal human gastrointestinal epithelial cells. The target structure especially comprises alphaébeta4 integrin. This is a tumnur-associated antigen. The antibody, and its fragments, are useful for treating conditions based on anti-angiogenic mechanism in humans. They are useful for treating human metastatic and malignant disease, for in vivo diagnosis and prognosis of human malignant disease, comprising tumour typing, tumour screening, tumour diagnosis and monitoring premalignant conditions. Quantitative in vivo diagnosis as carried out by determining the localization of antibody to
                                                                                                                                                                                                                                                                                                           Novel antibody for diagnosis, treatment of human metastatic and malignant diseases, has binding structure for target structure displayed on cell surface of human gastrointestinal epithelial tumor and normal cells.

```
The present invention relates to a phage display library of variable heavy domain (VHH or VH) fragments (sdAb fragments) derived from llama antibodies. The library is useful for in vitro selection against any ratingen of interest as a target. Single domain anti-idiotypic antibody fragments are isolated from the library using phage display technology and an antibody serving as an antigen. Such anti-idiotypic antibody fragments have great potential in evoking the immune system response to pathological antigens and in vaccine development. The large size of the library considerably increases the probability of isolating from it cantigen-binding fragments having high affinity to almost any predetermined target (antigen of interest). The library eliminates the development of anti-idiotypic antibodies by immunisation and allows isolation of anti-idiotypic antibodies. AAU82435-AAU82635 represent the lama heavy chain domain fragments of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                      New phage display library of variable heavy domain antigen-binding fragments derived from llama antibodies, useful for in vitro selection against any antigen of interest as a target.
                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Page 19a; 46pp; English.

```
The present invention describes an antibody molecule (I) capable of georgically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence val-His-Glu-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly-ADA89887 or its fragment. Also described: (I) a nucleic acid molecule candor (I); (2) a vector comprising the nucleic acid of (I); (3) a host cell comprising the vector of (2); (4) preparing (I). comprising culturing the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I), nucleic acid of (I), vector of (2) or host cell of (3); (4) optimising (I) culturing the resulting Fab optimisation library by panning (I); (8) testing the resulting Fab optimised clones; (10) expressing of selected, optimised clones; (11) reparing a pharmaceutical composition, comprising optimised clones; (11) and formulating the composition of (I), and formulating the composition optimised antibody molecule with a carrier; and (12) a paramaceutical composition of the composition of the carrier; and (12) a composition of the carrier; and (12) and th

pharmaceutical composition prepared by method (8). (I) has

```
neuroprotective, nootropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (1), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with amyloidogenesis and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the detection of sintegration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaques for four passive immunisation against bata-amyloid sease, hereditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, manyloidosis Dutch type, Parkinson's disease, HIV-related dementia amyloidosis used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antibody molecule, antibody, beta-A4 peptide, Abeta4; neuroprotective, nootropic; antiparkinsonian; gene therapy, amyloidogenesis, amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer's disease; motor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral haemorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-44 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antibody molecule capable of specifically recognizing two regions the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation

control of the properties of the stagment, and the second region comprises the amino acid sequence Val-His-His-Gill-Lys-Leu-Val-Phe-Phe-Aid-Gill-Asp-Val-Cilly ADA89887 or its fragment. Also described: (1) a nucleic acid molecule calcid comprising (1); (2) a vector comprising (1); (2) a composition comprising (1); (2) a composition comprising (1); (2) and recovering (1) from the culture; (5) a composition comprising (1); or an antibody molecule produced by method (4); (6) a kit comprising (1); or concleic acid of (1), vector of (2) or host cell of (3); (7) optimising (1); or concleic acid of (1), vector of (2) or host cell of (3); (7) optimising (1); or concleic acid of (1); (8) testing the resulting Fab optimised clones; (10) expressing (1); of selected, optimised clones; (11) preparing a pharmaceutical composition prepared by method (8). (1) has composition, comprising optimised on the described molecule with a carrier; and (12) a composition, prepared by method (8). (1) has control of the rapy. The antibody molecule of (1), nucleic acid molecule, vector or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with composition of beta-amyloid plaques or for passive immunisation of the disease mentioned above. The antibody is used for the disease is consistable to may also be used in preparing a disease, motor neuropathy, Down's syndrome, consistent beta-amyloid plaque formation. In particular, the disease is dementia, Alzhaimer's disease, motor neuropathy, Down's syndrome, consistent beta-amyloid plaque formation. In particular, the disease is camploid of plaques or for passive immunisation adaption amyloid of plaques or for passive immunisation adaption amyloid of plaques or for passive immunisation adaption amyloid plaque formation. In particular, the disease is consisted but and place formation of beta-amyloid plaque formation will als

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first region comprises the amino acid sequence Ala-Gill-Phe-Arg-His-Asp-Ser-Gill-Ty-Tyr ADA8986 or its fragment, and the second region comprises the amino acid sequence val-His-His-Gill-Lys-Leu-Val-Phe-Phe-Ala-Gilu-Aps-Val-Gily ADA89887 or its fragment. Also described: (I) a nucleic acid molecule cancoding (I); (2) a vector comprising the nucleic acid of (1); (3) a host call comprising the vector of (2); (4) preparing (I), comprising (I) and recovering (I) from the culture; (5) a composition comprising (I), and recovering (I) broadled by method (4); (6) a kit comprising (I), vector of (2) in the recovering (I) broadled by method (4); (6) a kit comprising (I), and recovering (I) broadled by method (1); (1) and recovering (I) from the culture; (5) a composition comprising (I) dentifying optimisation library by panning (I); (B) testing the resulting Fab optimisation library by panning of selected, optimised clones; (11) preparing a pharmaceutical composition prepared by method (8); (1) has composition, composition of (I), and formulating the paramaceutical composition prepared by method (8); (1) has neutroprotective, nootropic and antiparkinsonian activities, and can be used in gene therapy. The antibody molecule (I), mucleic acid molecule (C) weetor or host is useful in preparing a pharmaceutical composition for the prevention and/or treatment of a disease associated with any also be used in preparing a diagnostic composition for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the denentia, Alahaimer's disease, mercomparation. In particular, the disease mentioned above. The antipody is used for the dementia, Alahaimer's disease, mercomparation of beta-amyloid plaque formation. In particular, the defence anyloid plaque formation of the prevention of the prevention New antibody molecule capable of specifically recognizing two regions of the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation Kretzschmar T; Huber W, Rothe C; Brockhaus M, Nordstedt C, Example 13; Page 92; 312pp; English. Bohrmann B, Loetscher H, WPI; 2003-663848/62. (e.g. dementia). Sequence 17 AA; Bardroff M, Loehning C,

The present invention describes an antibody molecule (I) capable of specifically recognising two regions of the beta-A4 peptide/Abeta4. The first reagion comprises the amino acid sequence Ala-Giu-Phe-Arg-His-App-Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gin-Lys-Leu-Val-Phe-Phe-Ala-Giu-Asp-Val-Gly ADA89886 or its fragment, Also described; (1) a mucleic acid molecule cocding (I); (2) a vector comprising the nucleic acid of (1); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising of culturing the host cell of (3) under conditions that allow synthesis of (I) and recovering (I) from the culture; (5) a composition comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I) cordinated acid of (1), vector of (2) or host cell.of (3); (7) peptimisation library by panning (I); (8) testing the resulting Fab optimised clones; (10) expressing (1); (8) testing the resulting Fab optimised clones; (10) expressing composition, comprising optimisation library by panning (I); (8) testing the resulting whethod (8). (1), and formulating the parameterisal composition prepared by method (8). (1) has composition prepared by method (8). (1) has composition comprising optimisation of 1), nucleic acid molecule, content or most is useful in preparing a pharmaceutical composition for the detection cut host is useful in preparing a pharmaceutical composition for the detection cut have anyloid-plaque formation. The antibody molecule content by a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the disease mentioned above. The antibody is used for the disease is confidential. The minimation of demential and pharmaceutical manyloid plaques or for passive immunisation confidence of the disease mentioned above. The antibody is used for the demantial manyloid plaques or proposition for the detection confidence or more confidence or more confidence or more confidence or more confidence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Creutzfeldt Jacob disease, hereditary cerebral haemorrhage with amyloidosis Dutch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     dementia, Alzheimer's disease, motor neuropathy, Down's syndrome,

The present invention describes an antibody molecule (I) capable of free present invention describes an antibody molecule (I) capable of first region comprises the amino acid sequence Ala-Glu-Phe-Aapper Ser-Gly-Tyr ADA89886 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment, and the second region comprises the encoding (I); (2) a vector comprising the nucleic acid molecule conclusing the host cell of (3) under conditions that allow synthesis of culturing the host cell of (3) under conditions that allow synthesis of (1) and recovering (I) from the culture; (5) a composition comprising (I), or an antibody molecule produced by method (4); (6) a kit comprising (I), corrected of (1), vector of (2) or host cell of (3) (7) optimising (I), corrected optimised clones; (1) preparing a pharmaceutical composition comprising optimised clones; (1) preparing a pharmaceutical composition comprising optimised clones; (1) preparing a pharmaceutical composition of (1), and formulating the pharmaceutical composition prepared by method (8); (1) has carrier; and (12) a pharmaceutical composition prepared by method (8). (1) has carrier, and can be neuroprotective, nootropic and antiparkinsonian activities, and can be recover to host is useful in preparing a disease associated with any also be used in preparing a disease associated with any also be used in preparing a disease associated with any also be used in preparing a disease associated with any also be used in preparing a disease associated with any also be used in preparing a disease associated with any also be used in preparing a disease associated with any also be used in preparing a disease associated with any and confidence of beta-amyloid plaque formation. In particular, the disease is dementia, Alzheimer's disease, motor neuropathy, Down's syndrome, creutifield Jacob disease, hereditary cerebral haemorias, and can be anyloidosis Dutch type, Parkinson's disease, HIV-relat New antibody molecule capable of specifically recognizing two regions of the beta-A4 peptide, useful for diagnosing, preventing or treating diseases associated with amyloidogenesis or amyloid-plaque formation Example 13; Page 92; 312pp; English. (e.g. dementia).

The first region comprises the amino acid sequence Ala-Glu-Phe-Arg-His-Asp-Ser-Gly-Tyr ADA8988 or its fragment, and the second region comprises the amino acid sequence Val-His-His-Gln-Lys-Leu-Val-Phe-Phe-Ala-Glu-Asp-Val-Gly ADA89887 or its fragment. Also described: (I) a nucleic acid molecule encoding (I), (2) a vector comprising the nucleic acid of (I); (3) a host cell comprising the vector of (2); (4) preparing (I), comprising cell comprising (I) and recovering (I) from the culturing that allow synthesis of (I) and recovering (I) from the culturing (S) a composition comprising (I) or an antibody molecule produced by method (4); (6) a kit comprising (I),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nootropic; antiparkinsonian; gene therapy; amyloidogenesis; amyloid-plaque formation; beta-amyloid plaque; immunisation; dementia; Alzheimer; disease; mctor neuropathy; Down's syndrome; Creutzfeldt Jacob disease; hereditary cerebral hæmorrhage; amyloidosis; Parkinson's disease; HIV-related dementia; amyotrophic lateral sclerosis;
used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       or an antibody molecule produced by method (4); (6) a kit comprising (1) nucleic acid of (1), vector of (2) or host cell of (3); (7) optimising (1); (8) testing the resulting Fab optimisation library by panning against Abeta4, (9) identifying optimised clones; (10) expressing of selected, optimised clones; (11) preparing a pharmaceutical composition, comprising optimisation of (1), and formulating the

pharmaceutical composition prepared by method (8). [1] has controlled composition prepared by method (8). [1] has controlled composition prepared by method (8). [1] has controlled composition prepared by method [8]. [1] has controlled composition and can be used in gene therapy. The antibody molecule [1], nucleic acid molecule, cettor or host is useful in preparing a pharmaceutical composition for the prevention and/or amyloid-plaque formation. The antibody molecule canyloidogenesis and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the detection of the disease, motor neuropathy. Down's syndrome, canyloidosis putch type, Parkinson's disease, InV-related dementia, amyloidosis Dutch type, Parkinson's disease, INV-related dementia, amyloidosis butch type, Parkinson's disease, INV-related dementia, amyloidosis used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel immunoglobulin molecules that comprise at least one antibody variable chain VH or VL framework region and are capable of binding to a specific antigens within an intracellular environment. Specifically, it refers to antibodies that can chorn an insoluble complex with a cognate antigen, such that it can then be target for degradation via the lysosome or proteosome systems. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of an intracellularly binding immunoglobulin comprising at least one antibody variable chain, in preparing a medicament for degrading one or more specific antigens, or for treating specific antigen positive cancer, e.g. leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         VH chain clone J48 of an intracellularly binding immunoglobulin SeqID 41.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibody; variable chain; cytostatic; cytoplasmic degradation; intracellular relocation; specific antigen positive cancer; leukaemia; lymphoma; intracellularly binding immunoglobulin; ras.

invention describes the specific target antigen as the oncogenic fusion protein BCR-ABL or the RAS antigen, such that this method can be used to protein a cytostatic medicament for the cytoplasmic degradation or intracellular relocation of such an antigen or for the treatment of the specific antigen positive cancer i.e. leukaemia or lymphoma. Furthermore, the immunoglobulins may also be used for therapeutic, prophylactic or diagnostic applications both in vitro and in vivo, as well as for assay and reagent applications or in functional genomics. This polypeptide sequence is a variable heavy chain (VH) framework region of an intracellularly binding anti-ras antibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         VH chain clone 33 of an intracellularly binding immunoglobulin SeqID 42.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antibody; variable chain; cytostatic; cytoplasmic degradation; intracellular relocation; specific antigen positive cancer; leukaemia; lymphoma; intracellularly binding immunoglobulin; ras.

This invention relates to novel immunoglobulin molecules that comprise at capable of binding to a specific antigens within an intracellular environment. Specifically, it refers to antibodies that can form an insoluble complex with a cognate antigen, such that it can then be target insoluble complex with a cognate antigen, such that it can then be target for degradation via the lysosome or proteosome systems. The present invention describes the specific target antigen as the oncognic fusion protein BCR-ABL or the RAS antigen, such that this method can be used to prepare a cytostatic medicament for the cytoplasmic degradation or intracellular relocation of such an antigen or for the treatment of the specific antigen positive cancer i.e. leukaemia or lymphoma. Furthermore, the immunoglobulins may also be used for therapeutic, prophylactic or
Use of an intracellularly binding immunoglobulin comprising at least one antibody variable chain, in preparing a medicament for degrading one or more specific antigens, or for treating specific antigen positive cancer, e.g. leukemia.
                                                                                                                                                                                                                                                                                                                                                            Example 7; SEQ ID NO 42; 86pp; English.

one WH framework region amino acid sequence showing at least 85 % identity with the framework region consensus sequence (1), and/or a molecule having at least one WH framework region amino acid sequence showing at least one WH framework region amino acid sequence showing at least 85 % identity with (1), where one or more of amino acids 22 and 92 are not cysteine residues. The immunoglobulin suitable for in vitro use can be produced by a library, generated using any one or more of the WH framework region amino acid sequences cited above. The antibody molecule is of a single variable domain type antibody is a heavy or light chain variable domain variable domain. The immunoglobulin molecule is useful for the specific binding of a ligand within an in vitro environment. Sequences Abp66604-Abp66613 represent variable domain heavy chain (WH) sequences of anti-RAS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New immunoglobulin molecule comprising at least one VH framework region amino acid sequence, useful for the specific binding of a ligand within an in vitro environment.

The invention relates to an immunoglobulin molecule comprising at least to one VH framework region amino acid sequence showing at least BS $ identity with the framework region consensus sequence (1), and/or a molecule having at least one VH framework region amino acid sequence showing at least one VH framework region amino acid sequence can be or cysteline residues. The immunoglobulin suitable for in vitro use can be produced by a library, generated using any one or more of the VH framework region amino acid sequences cited above. The antibody variable domain type antibody is a heavy or light chain variable domain antibody. The single antibody comprises at least light and at least heavy chain variable domain. The immunoglobulin molecule is useful for the specific binding of a ligand within an in vitro environment. Sequences ADP66604-ADP66611 represent variable domain heavy chain (VH) sequences of anti-RAS

```
New immunoglobulin molecule comprising at least one VH framework region amino acid sequence, useful for the specific binding of a ligand within an in vitro environment.
Anti-RAS intracellular scFV 33 VH chain, SEQ ID 3.
                RAS; immunoglobulin; anti-RAS antibody; scFV

New immunoglobulin molecule comprising at least one VH framework region amino acid sequence, useful for the specific binding of a ligand within an in vitro environment.

Example 3; Fig 3; 67pp; English.

The invention relates to an immunoglobulin molecule comprising at least one VH framework region amino acid sequence. Showing at least 85 % identity with the framework region consensus sequence (1), and/or a molecule having at least one VH framework region amino acid sequence showing at least 85 % identity with (1), where one or more of amino acids 22 and 92 are not cysteine residues. The immunoglobulin suitable for in virto use can be produced by a library, generated using any one or more of the VH framework region amino acid sequences cited above. The antibody molecule is of a single variable domain type antibody is a heavy or light chain variable domain cype antibody comprises at least light and at least heavy chain variable domain. The immunoglobulin molecule is useful for the specific binding of a ligand within an in vitro environment. Sequences ADP666604intracellular scFVs 8X4X4X4X4444X8X2CCCCCCCCCX

GENERAL INFORMATION:

APPLICANT: Siegel, Donald L.

TITLE OF INVENTION: Rh(D)-BINDING PROTEINS AND MAGNETICALLY ACTIVATED CELL

TITLE OF INVENTION: SORTING METHOD FOR PRODUCTION THEREOF

FILE REFERENCE: 09596-42U2

CURRENT FAPLICATION NUMBER: US/09/240,274

CURRENT FILING DATE: 1999-01-29

EARLIER APPLICATION NUMBER: 60/081,380

EARLIER APPLICATION NUMBER: 60/081,550

EARLIER PILING DATE: 1998-04-10

EARLIER PILING DATE: 1998-10-11

NUMBER OF SEQ ID NOS: 224

SOFTWARE: PLING DATE: 1296-10-11

LENGTH: 129

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 172,

US-10-088-639A-2_COPY_177_193 85 1 VISENGRTINYADSVKG 17 Title: Perfect score:

Sequence:

BLOSUM62 Gapop 10.0 , Gapext 0.5 Scoring table:

283416 seqs, 96216763 residues Searched:

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

PIR 79:* Database :

pirl:* pir2:* pir3:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Goni F., Frangione B.;

"Amino acid sequence of the Fv region of a human monoclonal IgM
(protein WEA) with antibody activity against 3,4-pyruvylated
galactose in Klebsiella polysaccharides K30 and K33.";

Proc. Natl. Acad. Sci. U.S.A. 80:4837-4841(1983).

-! MISCELLANBOUGS: THIS CHAIN WAS OBTAINED FROM A MONOCLONAL ANTIBODY
AGAINST 3,4-PYRUVYLATED GALACTOSE AND ISOLATED FROM A PATIENT WITH
WALDENSTROM'S MACROGLOBULINEMIA.
-! SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21-JUL-1986 (Rel. 01, Created)

-!- PATHWAY: Galactose metabolism, first step.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Potential).
-!- SIMILARITY: Belongs to the GHMP kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bacteria; Proteobacteria; Gammaproteobacteria; Enterobacteriales;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PATHWAY: NAD biosynthesis; aspartate to NaMN; first step.
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
SIMILARITY: BELONGS TO THE FAD-DEPENDENT OXIDOREDUCTASE FAMILY 2.
                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                             28-FEB-2003 (Rel. 41, Created)
28-FEB-2003 (Rel. 41, Last sequence update)
38-FEB-2003 (Rel. 41, Last annotation update)
L-aspartate oxidase (EC 1.4.3.16) (LASPO) (Quinolinate synthetase B)
NADB OR NMA2092.
